

# COLLECTIVE VARIABLES MODULE

## Reference manual for LAMMPS

September 8, 2015

Giacomo Fiorin, Jérôme Hénin, Axel Kohlmeyer

# Contents

<b>1</b>	<b>Introduction</b>	<b>3</b>
<b>2</b>	<b>General parameters and input/output files</b>	<b>3</b>
2.1	LAMMPS keywords	3
2.2	Configuration syntax for the collective variables module	5
2.3	Input state file (optional)	7
2.4	Output files	7
<b>3</b>	<b>Defining collective variables and their properties</b>	<b>8</b>
3.1	General options for a collective variable	8
3.2	Artificial boundary potentials (walls)	9
3.3	Trajectory output	10
3.4	Extended Lagrangian.	11
3.5	Statistical analysis of collective variables	12
<b>4</b>	<b>Selecting atoms for colvars: defining atom groups</b>	<b>14</b>
4.1	Selection keywords	14
4.2	Moving frame of reference.	15
4.3	Treatment of periodic boundary conditions.	17
4.4	Computational cost of colvars based on group size.	17
<b>5</b>	<b>Collective variable components (basis functions)</b>	<b>17</b>
5.1	List of available colvar components	18
5.1.1	distance: center-of-mass distance between two groups.	18
5.1.2	distanceZ: projection of a distance vector on an axis.	19
5.1.3	distanceXY: modulus of the projection of a distance vector on a plane.	20
5.1.4	distanceVec: distance vector between two groups.	20
5.1.5	distanceDir: distance unit vector between two groups.	20
5.1.6	distanceInv: mean distance between two groups of atoms.	21
5.1.7	cartesian: vector of atomic Cartesian coordinates.	21
5.1.8	angle: angle between three groups.	21
5.1.9	dihedral: torsional angle between four groups.	21
5.1.10	coordNum: coordination number between two groups.	22
5.1.11	selfCoordNum: coordination number between atoms within a group.	23
5.1.12	hBond: hydrogen bond between two atoms.	23
5.1.13	rmsd: root mean square displacement (RMSD) from reference positions.	23
5.1.14	Advanced usage of the rmsd component.	24
5.1.15	eigenvector: projection of the atomic coordinates on a vector.	24
5.1.16	gyration: radius of gyration of a group of atoms.	25
5.1.17	inertia: total moment of inertia of a group of atoms.	25
5.1.18	inertiaZ: total moment of inertia of a group of atoms around a chosen axis.	26
5.1.19	orientation: orientation from reference coordinates.	26
5.1.20	orientationAngle: angle of rotation from reference coordinates.	27
5.1.21	orientationProj: cosine of the angle of rotation from reference coordinates.	27
5.1.22	spinAngle: angle of rotation around a given axis.	27
5.1.23	tilt: cosine of the rotation orthogonal to a given axis.	27

5.2	Advanced usage and special considerations	27
5.2.1	Periodic components.	27
5.2.2	Non-scalar components.	28
5.2.3	Calculating system forces.	29
5.3	Linear and polynomial combinations of components	29
<b>6</b>	<b>Biasing and analysis methods</b>	<b>29</b>
6.1	Adaptive Biasing Force	30
6.1.1	ABF requirements on collective variables	31
6.1.2	Parameters for ABF	32
6.1.3	Output files	33
6.1.4	Post-processing: reconstructing a multidimensional free energy surface	34
6.2	Metadynamics	35
6.2.1	Output files	36
6.2.2	Performance tuning	37
6.2.3	Well-tempered metadynamics	37
6.2.4	Multiple-replicas metadynamics	38
6.2.5	Compatibility and post-processing	39
6.3	Harmonic restraints	39
6.3.1	Moving restraints: steered molecular dynamics	40
6.3.2	Moving restraints: umbrella sampling	41
6.3.3	Changing force constant	42
6.4	Linear restraints	42
6.5	Adaptive Linear Bias/Experiment Directed Simulation	43
6.6	Multidimensional histograms	44
